Feature Release list contained in Version 3.1.4

New + Improved

1. Visual Enhancement for MyBloodHealth dashboard
2. Mapping icon will display number of items needing mapped
3. Enhancement to display medication dosages provided to client
4. CPT code added to case description

Detailed Product Release Description

1. Visual Enhancement for MyBloodHealth Dashboard

The view for the performance dashboard will now show data in a widget format showing the last 30 days of data. The user can filter the report by location and case type. Reports can be exported in both excel and PDF format.

2. Mapping icon will display number of items needing mapped

Currently when a new lab type or case type needs to be mapped, there is an icon which will appear. With the enhancement, the user will view the number of lab types/case types that will need to be mapped.

3. Enhancement to display medication dosages provided to client

The enhancement for medication dosage allows the user to select the number of medication treatments provided to the client. This change allows the user to view their Medication Revenue, ROI Impact, and Treatment Volume reports with correct information.

4. CPT code added to case description

When completing case type mapping, CPT (Current Procedural Terminology) code will be added to search for surgery type.
