 5. Surgical Complete Case Options to add Not Treated Option and Refer to Chronic Worklist
 6. Client Dashboard: Sync User Login total with Login Statistic report to show unique user logins per day
-

Detailed Product Release Description

1. New report filter to view provider specific data analysis

Previously the user did not have the ability to filter reports by a specific provider. Based on user feedback an enhancement was made to add the option to the filter an MBH report drop down filter menu to select a specific provider.

2. Opportunity Report: Add number of patients

Previously the user did not have the ability to view the number of patients and the total dollar amount in each case type category displayed on the opportunity report. The new enhancement adds a hover functionality for the user to view the total number of patients and corresponding dollar amount in each case type category displayed. This enhancement allows the user to hover over a specific block of data in the report to view the total number of patients and revenue opportunity for anemia management intervention. The total number of patient and revenue opportunities by case type is also included in data that is exported by the user.

3. Medication Revenue Report: Ability to view the total revenue contribution by intervention and dollar amount

Previously the user did not have the ability to view the view the total revenue contribution by intervention and dollar amount on the medication revenue report. The new enhancement adds visualization of the total revenue dollars by intervention (IV iron, EPO, or B12) provided in treatment of anemic patients. Now the user will see a total revenue stack bar and all dollar values have a \$ symbol added.

4. Chronic Complete: Functionality to document the reason a follow up appointment is not needed

Previously the user did not have the ability to complete a chronic case and document the reason a follow up visit is not needed for a chronic patient type, the menu selections were for surgical patient populations. The enhancement provides the user with the ability to complete a chronic visit and document the reason that a follow up appointment is not needed. The options available in the chronic no follow up reason menu have been refined for the chronic patient population.

5. Surgical Complete Case Options to add Not Treated Option and Refer to Chronic Worklist

Previously the user did not have the ability to select the non-treatment option, document a reason for non-treatment the refer the patient onto the chronic worklist for follow up treatment when completing a surgical case. The enhancement provides the user with the ability to complete a surgical case and document treatment not provided and needs to be referred for chronic visit follow up by adding a radio button confirming referral to chronic treatment is necessary. The user will be able to select date for Chronic follow up visit. The patient surgical visit information from MBH will be mirrored onto the chronic worklist.

6. Client Dashboard: Sync User login total with Login Statistic report to show unique user logins per day

Previously the user view of login number on the client dashboard displayed total non-unique user logins and did not match the login statistics report for the same timeframe selected based on new report logic applied to display unique login per day in the previous release. An enhancement was made to the client dashboard to sync to the dashboard logic to the login statistic report which now displays the number of unique user logins per day on the dashboard view and the export data view.
